

VAV terminal units

Differential pressure measurement via damper blade

Compact controller with display

Installation directly on the main duct

Conforms to VDI 6022

Compact solution for low airflow velocities

Angular air terminal units for use in variable air terminal systems at low air velocities, even under unfavourable upstream conditions

- Tubeless differential pressure measurement via damper blade
- Differential pressure transmission through differential pressure duct in shaft
- Connection terminals with protective cover, no junction box required
- Any airflow direction if dynamic transducer is used
- Suitable for air velocities from 0.8 8 m/s
- Compact dimensions for use in confined ceiling areas
- Plug-and-play solution in conjunction with X-AIRCONTROL room control
- Exact measurement even with low airflow velocities
- Any installation orientation also with static transducer
- Closed blade air leakage to EN 1751, at least class 2
- Casing air leakage according to EN 1751, class C
- Volume flow rate range 1:10
- Optional equipment and accessories
- Secondary silencer to reduce air-regenerated noise
- Hot water heat exchanger Type WT for reheating the airflow

PD-04/2024 - DE/en

Order code

Variants

- EASY controller: compact unit consisting of controller with potentiometers, differential pressure transducer and actuator
- Compact controller: compact unit consisting of controller, differential pressure transducer and actuator
- Compact controller Modbus: variant with Modbus RTU interface and disply; Plug-and-play solution in conjunction with X-AIRCONTROL room control
- Compact controller BACnet: Variant with BACnet-MS/TP interface and display; can also be converted to Modbus RTU by the customer

Useful additions

- Secondary silencer Type TX for the reduction of airregenerated noise
- Hot water heat exchanger Type WT for reheating the airflow

Construction features

- Rectangular casing
- Flanges on both ends, suitable for duct connections
- Position of the damper blade indicated externally at position indicator
- Simple exchange of the control components possible

Material and surfaces

Galvanised sheet steel

- Casing, damper blade made of galvanised sheet steel
- Shaft made of PA6 ($H \le 200$) or aluminium (H > 200)
- Damper blade seal and sealing plug made of EPDM
- Bearing bushes made of PBT or TPU
- Fastening (screws, rivets) Galvanised steel, aluminium Powder-coated construction (P1)
- Casing, damper blade galvanised with powder coating, RAL 7001, silver-grey
- Shaft made of PA6 (H ≤ 200) or aluminium (H > 200)
- Damper blade seal and sealing plug made of EPDM
- Bearing bushes made of PBT or TPU
- Fastening (screws, rivets) stainless steel, aluminium

Standards and guidelines

Meets the hygiene requirements of

- EN 16798, Part 3
- VDI 6022, Sheet 1
- DIN 1946, Part 4
- For further standards and guidelines, please refer to the hygiene certificate

Casing air leakage

• EN 1751, Class C Closed damper blade air leakage:

NS 200 × 100, NS 300 × 100, NS 200 × 200

• EN 1751, Class 2

- NS 300 × 200, NS 400 × 200, NS 500 × 200, NS 600 × 200
- EN 1751, Class 3

Maintenance

 Maintenance-free as construction and materials are not subject to wear and tear

Application

- Square VAV terminal units for use in ventilation and air conditioning systems (AHUs)
- For almost all tasks when controlling, restricting, or shutting off supply and extract air flows
- Also for unfavourable upstream conditions at low air velocities
- Closed-loop volume flow control using an external power supply
- For variable or constant volume flow systems
- Shut-off by override control (by the client)

Special characteristics

- · High differential pressure signal with small angle of attack
- Factory set-up or programming and aerodynamic function testing
- Volume flow rate can be measured and subsequently adjusted. Additional adjustment tool may be required (depending on the variant of the control component)
- Tubeless differential pressure measurement via damper blade
- Differential pressure transmission through differential pressure duct in axis
- Any airflow direction if dynamic transducer is used
- Any installation orientation also with static transducer
- Suitable for air velocities from 0.8 8 m/s
- · Compact dimensions for use in confined ceiling areas

Nominal sizes

- 200 × 100, 300 × 100
- 200 × 200, 300 × 200, 400 × 200, 500 × 200, 600 × 200

Variants

- TVE-Q: VAV terminal unit
- TVE-Q with TX secondary silencer to reduce air-regenerated noise

Construction

- Galvanised sheet steel
- P1: Powder-coated, silver grey (RAL 7001)

Parts and characteristics

- Ready-to-commission unit which consists of mechanical parts and control components.
- Damper blade with integrated measuring unit
- Axis with differential pressure duct for measured value transmission
- Control component factory mounted
- Each unit is tested on a special aerodynamic test rig at the factory
- Documentation of the test rig data with a test label or a volume flow scale on the unit
- High control accuracy even in case of unfavourable upstream conditions

Function

Functional description

The damper blade works as a control element and as a differential pressure sensor. Through the differential pressure duct in the shaft, the detected differential pressure reaches the transducer (static or dynamic), and is converted into an electrical

signal and compared with the setpoint value. In case of a control deviation, the integrated actuator changes the position of the damper blade. Thereby, the volume flow rate is kept constant in close tolerances over the entire differential pressure range.

- 1 Flange for air duct profiles
- 2 Casing
- 3 Damper blade including differential pressure sensor
- 4 Axis with differential pressure duct
- 5 Electronic volume flow controller
- 6 Preferred airflow direction

Technical data

| Nominal sizes | 200 × 100, 300 × 100 200 × 200, 300 × 200, 400 × 200, 500 × 200, 600 × 200 | |
|---|---|--|
| Volume flow rate range | 16 - 960 l/s or 58 - 3456 m³/h | |
| Volume flow rate control range (controller with dynamic differential pressure measurements) | approx. 10 - 100 % of the nominal volume flow rate | |
| Minimum differential pressure | up to 50 Pa (without secondary silencer) | |
| Maximum differential pressure | Control component with dynamic transducer: 900 Pa, Control component with static transducer: 600 Pa | |
| Operating temperature | 10 to 50 °C | |

Quick sizing

Quick sizing tables provide a good overview of the minimum pressure differences, the volume flow accuracy Δq_v and the expected sound pressure levels in the room. Intermediate values may be achieved by interpolation. The sound power levels for calculating the sound pressure levels were measured in the TROX laboratory according to DIN EN ISO 5135 - see "Basic information and nomenclature". Precise results and spectral data for all control components can be obtained by using our Easy Product Finder design programme. The nominal size is initially selected according to the given volume flow rates q_{vmin} and q_{vmax} .

Volume flow rate ranges and minimum differential pressure values

The minimum differential pressure of VAV terminal units is an important factor in designing the ductwork and in rating the fan including speed control. It must be ensured that for all operating conditions and for all terminal units, a sufficient differential pressure is applied to each controller (Δp_{stmin}). The measurement point(s) for fan speed control must be selected accordingly. The volume flow rate range for VAV terminal units depends on the nominal size and on the control component (attachment) used.

Volume flow rate ranges and minimum differential pressure Controller for dynamic and static measuring principle Attachment: Easy, XB0, XM0, XM0-J6, XS0, XS0-J6, XDMB0, XSMB0

Quick sizing table for sound pressure levels

The quick sizing tables include common sound insulation and attenuation values. If the sound pressure level is above the permissible value, a larger air terminal unit and/or a silencer or acoustic cladding are required. For more information on the acoustic data, see Basic Information and Nomenclature.

Quick sizing table for air-regenerated noise L_{PA}

(1) Basic unit

Specification text

This specification text describes the general properties of the product. Texts for variants can be generated with our Easy Product Finder design programme.

Specification text

VAV terminal units in rectangular design for variable and constant volume flow systems, for supply air or extract air, in several nominal sizes. High control accuracy of set volume flow rates, even in unfavourable upstream conditions. Control range at least 1:10. Differential pressure measurement and control via damper blade. Tubeless differential pressure transmission through differential pressure duct in shaft Closed blade air leakage according to EN 1751: class 2 or 3 depending on nominal size. Casing air leakage according to EN 1751, class C Ready-to-commission unit which consists of the mechanical parts and the factory mounted electronic control component. Position of the damper blade indicated externally at the control component. The damper blade is factory set to open position, which allows a ventilation airflow even without control. Meets the hygiene requirements of EN 16798, Part 3, of VDI 6022, Sheet 1, and of DIN 1946, Part 4.

Special characteristics

- · High differential pressure signal with small angle of attack
- Factory set-up or programming and aerodynamic function testing
- Volume flow rate can be measured and subsequently adjusted. Additional adjustment tool may be required (depending on the variant of the control component)
- Tubeless differential pressure measurement via damper blade
- Differential pressure transmission through differential pressure duct in axis
- Any airflow direction if dynamic transducer is used
- · Any installation orientation also with static transducer
- Suitable for air velocities from 0.8 8 m/s
- Compact dimensions for use in confined ceiling areas

Materials and surfaces

- · Casing and damper blade made of galvanised sheet steel
- Shaft made of PA6, UL94-V0 (H ≤ 200) or aluminium (H > 200)
- Closed-cell damper blade seal made of EPDM
- Bearings made of plastic

Equivalence criteria

- Declaration of hygiene conformity in accordance with VDI 6022, part 1 (01/2018), ÖNORM H 6020 (03/2015) and ÖNORM H 6021 (08/2016)
- Independent of air direction air flow in both directions
- Suitable for airflow velocities of 0.8 8 m/s
- No inflow lengths required (even after T-piece)

- Meets the hygiene requirements according to EN 16798 Part
 3, VDI 6022 Sheet 1, DIN 1946 Part 4
- Setting the volume flow rates without adjustment device via V_{min} and V_{max} -potentiometer
- Electrical connections with screw terminals, no additional connection box required
- Acoustic data determined according to ÖNORM EN ISO 5135
- Maximum control deviation of 5 % at q_{vmax}, without upstream section

Connection type

Flanges on both ends, suitable for duct connections

Technical data

Minimum differential pressure: up to 50 Pa (without secondary silencer)

Maximum differential pressure

- Control component with dynamic transducer: 900 Pa
- Control component with static transducer: 600 Pa

Closed blade air leakage, class 2 or 3 depending on nominal size.

Specification text attachment

Variable volume flow control with electronic Easy controller for applying a reference value and capturing an actual value to be integrated with the central BMS.

- 24 V AC/DC supply voltage
- Signal voltages 0 10 V DC
- Possible override controls with external switches using volt-free contacts: CLOSE, OPEN, $q_{\mbox{vmin}}$ and $q_{\mbox{vmax}}$
- Potentiometers with percentage scales to set the volume flow rates q_{vmin} and q_{vmax}
- The actual value signal relates to the nominal volume flow rate so that commissioning and subsequent adjustment are simplified
- Volume flow rate control range: approx. 10 100% of the nominal volume flow rate
- Visible indicator light for signalling the various operating conditions
- Electrical connections with screw terminals.
- Double screw terminals for looping the supply voltage, i.e. for simple connection of voltage transmission to the next controller.

Life cycle assessment

A life cycle assessment is available for the product series in form of an Environmental Product Declaration (EPD) that has been checked and published by a programme holder.

Order code

Order code for volume flow control (with Easy controller)

1 Type TVE-Q VAV air terminal unit

3 Nominal size [mm] Specify width × height

Access to control components, mounted on one side

Space required for single-sided installation

| Attachment | (1) | (2) | (3) |
|--|-----|-----|-----|
| Easy controller: Easy | 250 | 200 | 300 |
| Compact controller: XB0, XM0, XM0-J6, XS0, XS0-J6, XDMB0, XSMB0 | 250 | 200 | 300 |

Space required for commissioning and maintenance

Sufficient space must be kept clear near any attachments to allow for commissioning and maintenance. It may be necessary to provide sufficiently sized inspection access openings.

Product details

Installation and commissioning

- Almost any installation orientation
- · EN 1505 must be considered when making air duct connections, such as the junction from a main duct

Upstream conditions

The differential pressure, which is decisive for the volume flow rate, is recorded and averaged on the damper blade. Therefore, the volume flow rate accuracy Δ_{qv} is independent of the upstream length, but in case of junctions from the main line, dependent on the installation variant of the control unit in the branch duct.

Product data sheet

Bend, vertical

Bend, horizontal

Junction, vertical

A bend without additional straight upstream flow length in front of the VAV control unit has no significant influence on the volume flow rate accuracy Δq_v .

A junction from main duct causes strong turbulence. The specified volume flow rate accuracy Δq_v can be achieved for installation variants 1 and 2 without an upstream section. For installation variants 3 and 4, the specified volume flow rate accuracy Δq_v can also be achieved without an upstream section if the installation position of the control unit is adapted to the air direction in the main duct.

A bend without additional straight upstream flow length in front of the VAV control unit has no significant influence on the volume flow rate accuracy Δq_v .

accuracy Δq_v can also be achieved without an upstream if the installation position of the control unit is adapted to direction in the main duct. Junction, horizontal

A junction from main duct causes strong turbulence. The specified volume flow rate accuracy Δq_v can be achieved for installation variants 1 and 2 without an upstream section. For installation variants 3 and 4, the specified volume flow rate accuracy Δq_v can also be achieved without an upstream section if the installation position of the control unit is adapted to the air direction in the main duct.

Junction from main duct: Installation variant 1

Airflow direction A or B have no significant influence on Δq_v .

Junction from main duct: Installation variant 3

For airflow direction A in the main duct: specified volume flow rate accuracy Δq_v achievable.

For airflow direction B in the main duct: for the specified volume flow rate accuracy Δq_v a surcharge of 10 % must be taken into account in the upper third of the nominal volume flow flow rate accuracy Δq_v achievable. range.

Junction from main duct: Installation variant 2

Airflow direction A or B have no significant influence on Δq_v .

Junction from main duct: Installation variant 4

For airflow direction A in the main duct: for the specified volume flow rate accuracy $\Delta q_{_{\nu}}$ a surcharge of 10 % must be taken into account in the upper third of the nominal volume flow range.

For airflow direction B in the main duct: specified volume

| Attachment | Controlled variable | Interface | Effective pressure transducer | Actuator | Manufactur r |

Explanation

Dimensions of rectangular units

B [mm]; [in] Duct width

B, [mm]; [in] Screw hole pitch of flange (horizontal)

B₂ [mm]; [in]Overall dimension of flange (width)

H [mm]; [in] Duct height

H₁ [mm]; [in] Screw hole pitch of flange (vertical)

H₂ [mm]; [in]Overall dimension of flange (height)

Dimensions of circular units

ØD [mm]; [in] Basic units made of sheet steel: Outer diameter of the spigot; basic units made of plastic: Inside diameter of the spigot

ØD₁ [mm]; [in] Pitch circle diameter of flanges

ØD₂ [mm]; [in] Outer diameter of flanges

L [mm]; [in] Length of unit including connecting spigot

L₁ [mm]; [in] Length of casing or acoustic cladding

n [] Number of flange screw holes

T [mm]; [in] Flange thickness

General information

m [kg]; [lb] Unit weight including the minimum required attachments (control component)

NS [mm]; [in] Nominal size

f_m [Hz] Octave band centre frequency

L_{PA} [dB(A)]

A-weighted sound pressure level of air-regenerated noise of the CAV controller, system attenuation taken into account

 L_{PA1} [dB(A)]

A-weighted sound pressure level of air-regenerated noise of the CAV controller with secondary silencer, system attenuation taken into account

L_{PA2} [dB(A)]

A-weighted sound pressure level of case-regenerated noise of the CAV controller, system attenuation taken into account

L_{PA3} [dB(A)]

A-weighted sound pressure level of case-regenerated noise of the CAV controller with acoustic cladding, system attenuation taken into account

Note on acoustic data: All sound pressure levels are based on a reference value of 20 $\mu \text{Pa}.$

q_{vNom} [m3/h]; [l/s]; [CFM]

Nominal flow rate (100 %): The value depends on product type, nominal size and control component (attachment). Values are published on the internet and in technical leaflets and defined in the Easy Product Finder design programme. Reference value for calculating percentages (e.g. q_{vmax}). Upper limit of the setting range and maximum volume flow rate setpoint value for the VAV terminal unit.

q_{vmin Unit} [m3/h]; [l/s]; [CFM]

Technical minimum volume flow: The value depends on product type, nominal size and control component (attachment). Values are defined in the Easy Product Finder design programme Lower limit of the setting range and minimum volume flow rate setpoint value for the VAV terminal unit. Setpoint values below q_{vmin unit} (if q_{vmin} equals zero) may result in unstable control or shut-off.

q_{vmax} [m3/h]; [l/s]; [CFM]

Client-adjustable upper limit of the operating range for the VAV terminal unit: q_{vmax} can be set to less than or equal to q_{vNom} on the terminal unit. In case of analogue control of volume flow controllers (typically used), the maximum value of the setpoint signal (10 V) is assigned to the set maximum value (q_{vmax} , see characteristics.

q_{vmin} [m3/h]; [l/s]; [CFM]

Client-adjustable lower limit of the operating range of the VAV terminal unit: q_{vmin} should be set to less than or equal to q_{vmax} . q_{vmin} must not be set to less than $q_{vmin\,unit}$, as the control may become unstable or the damper blade may close. q_{vmin} may equal zero. In case of analogue control of volume flow controllers (typically used), the minimum value of the setpoint signal (0 or 2 V) is assigned to the set minimum value (q_{vmin} , see characteristics.

q_v [m3/h]; [l/s]; [CFM] Volume flow rate

 $\Delta_{_{qv}}\,[\%]$ Volume flow rate accuracy in relation to the setpoint (tolerance)

Δp_{st} [Pa]; [inWg] Static differential pressure

∆p_{stmin} [Pa]; [inWg]

Static minimum differential pressure: The static minimum differential pressure is equal to the pressure loss of the VAV terminal unit when the damper blade is open, caused by flow resistance (damper blade). If the pressure on the CAV controller is too low, the setpoint volume flow rate may not be achieved, not even when the damper blade is open. Important factor in designing the ductwork and in rating the fan including speed control. Sufficient static differential pressure must be ensured for all operating conditions and for all controllers, and the measurement point or points for speed control must have been selected accordingly to achieve this.

Lengths [mm]; [in]

All lengths are given in millimetres [mm] unless stated otherwise.

Basic unit

Unit for controlling volume flow rates without an attached control component. The main components include the casing with sensor(s) to measure the differential pressure and the damper blade to restrict the volume flow. The basic unit is also referred

to as a VAV terminal unit. Important distinguishing features: Geometry or unit shape, material and connection variants, acoustic characteristics (e.g. optional acoustic cladding or integrated silencers), range of volume flow.

Control component

Electronic unit(s) mounted on the basic unit to control the volume flow rate, or the duct pressure, or the room pressure by adjusting the damper blade position. The electronic unit essentially consists of a controller with differential pressure transmitter (integrated or external) and an integrated actuator (Easy and Compact controller).

Important distinguishing features:

- Transmitter: dynamic transmitter for clean air or static transmitter for contaminated air
- Actuator: Standard actuator, slow-running
- Interface technology: analogue interface or digital bus interface for connecting and recording signals and data

Volume flow controller

Consists of a basic unit with an attached control component.
